Enzymatic Method And Compositions For Treating  
-- Intravitreal Hemorrhagic Blood

5

**Field of the Invention**

The present invention relates generally to enzyme preparations for therapeutic administration to the eyes of humans or other mammals, and more particularly to a) a method for utilizing one or more enzymes to accelerate the rate at which hemorrhagic blood is cleared from the vitreous body of the mammalian eye and b) an improved hyaluronidase preparation for ophthalmic administration.

15

**Background of the Invention**

**i. Anatomy of the Human Eye**

In human beings, the anatomy of the eye includes a "vitreous body" which occupies approximately four fifths of the cavity of the eyeball, behind the lens. The vitreous body is formed of gelatinous material, known as the vitreous humor. Typically, the vitreous humor of a normal human eye contains approximately 99% water along with 1% macromolecules including; collagen, hyaluronic acid, soluble glycoproteins, sugars and other low molecular weight metabolites.

The retina is essentially a layer of nervous tissue formed on the inner posterior surface of the eyeball. The retina is surrounded by a layer of cells known as the choroid layer. The retina may be divided into a) an optic portion which participates in the visual mechanism, and b) a non-optic portion which does not participate in the visual mechanism. The optic portion of the retina contains the rods and cones, which are the effectual organs of vision. A number of arteries and veins enter the retina at its center, and splay outwardly to provide blood circulation to the retina.

-2-

The posterior portion of the vitreous body is in direct contact with the retina. Networks of fibrillar strands extend from the retina and permeate or insert into the vitreous body so as to attach the vitreous body to the retina.

**ii. The Causes, Treatments and Clinical Sequelae Of Intravitreal Hemorrhage**

Diabetic retinopathy, trauma and other ophthalmological disorders sometimes result in rupture or leakage of retinal blood vessels with resultant bleeding into the vitreous humor of the eye (i.e., "intravitreal hemorrhage"). Such intravitreal hemorrhage typically manifests as clouding or opacification of the vitreous humor.

Intravitreal hemorrhage is sometimes, but not always, accompanied by tearing or detachment of the retina. In cases where the intravitreal hemorrhage is accompanied by a retinal tear or detachment, it is important that such retinal tear or detachment be promptly diagnosed and surgically repaired. Failure to promptly diagnose and repair the retinal tear or detachment may allow photo-receptor cells of the retina, in the region of the tear or detachment, to become necrotic. Such necrosis of the photoreceptor cells of the retina may result in loss of vision. Furthermore, allowing the retinal detachment to remain unrepaired for such extended period of time may result in further intravitreal hemorrhage and/or the formation of fibrous tissue at the site of the hemorrhage. Such formation of

-3-

fibrous tissue may result in the formation of an undesirable fibrous attachment between the vitreous body and the retina.

The typical surgical procedure used for repair of  
5 retinal tears or detachment requires that the surgeon be able to look through the vitreous humor, to visualize the damaged region of the retina (i.e., "transvitreal viewing of the retina"). When intravitreal hemorrhage has occurred, the presence of the hemorrhagic blood  
10 within the vitreous can cause the vitreous to become so cloudy that the surgeon is prevented from visualizing the retina through the vitreous. Such hemorrhagic clouding of the vitreous can take 6-12 months or longer to clear sufficiently to permit trans-vitreous viewing of the  
15 retina. However, in view of the potential complications which may result from delayed diagnosis or treatment of a retinal tear or detachment, it is generally not desirable to wait for such natural clearance of the hemorrhagic blood to occur.

20 Furthermore, even when the intravitreal hemorrhage is not accompanied by retinal tear or detachment, it is often difficult to verify that retinal tear or detachment has not occurred, because the hemorrhagic clouding of the vitreous prevents the physician from performing routine  
25 fundusoscopic examination of the retina. Moreover, the presence of hemorrhagic blood within the vitreous may significantly impair the patient's vision through the affected eye, and will continue to do so until such time

-4-

as the hemorrhagic blood has been substantially or fully cleared.

Thus, the presence of hemorrhagic blood within the vitreous body causes multiple clinical problems including

5 a) inability to visually examine and diagnose the site of the hemorrhage and/or any accompanying tear or detachment of the retina, b) full or partial impairment of vision in the affected eye and c) impairment or prevention of the performance of trans-vitreous surgical procedures of the

10 type typically utilized to repair the site of hemorrhage and/or to repair any accompanying retinal tear or detachment.

In cases where intravitreal hemorrhage has resulted in substantial clouding or opacification of the vitreous,

15 the treating physician may have the option to perform a procedure known as a vitrectomy, wherein all (or a portion of) the vitreous body is removed from the interior of the eye, and replaced with a clear liquid. The performance of such vitrectomy procedure is intended

20 to allow the surgeon to visualize the retina sufficiently to proceed with the necessary retinal examination and/or surgical repair of the hemorrhage and any accompanying retinal tear or detachment. However, such vitrectomy procedures are highly skill-intensive, and are associated

25 with several significant drawbacks, risks and complications. Among these drawbacks, risks and complications are the potential that the act of removing the vitreous will cause further detachment or tearing of

-5-

the retina and/or that such removal of the vitreous will cause further hemorrhage from the already-weakened retinal blood vessels.

5                   iii. Prior Ophthalmic Applications Of  
Hyaluronidase and Other Enzymes

In an effort to minimize the potential for causing further detachment or tearing of the retina during performance of vitrectomy, it has previously been  
10 proposed in U.S. Patent No. 5,292,509 (Hageman), to inject certain protease-free glycosaminoglycanase enzymes into the vitreous body, to cause the vitreous body to become uncoupled or "disinserted" from the retina, prior  
15 to removal of the vitreous body. Such disinsertion or uncoupling of the vitreous body is purported to minimize the likelihood that further tearing or detachment of the retina will occur as the vitreous body is removed. Examples of specific protease-free glycosaminoglycanase  
20 enzymes which may be used to bring about this vitreal disinsertion purportedly include; chondroitinase ABC, chondroitinase AC, chondroitinase B, chondroitin 4-sulfatase, chondroitin 6-sulfatase, hyaluronidase and  $\beta$ -glucuronidase.

25           Although hyaluronidase enzyme has been known to be usable for various ophthalmic applications, including the vitrectomy adjunct application described in U.S. Patent 5,292,509 (Hageman), published studies have indicated that the hyaluronidase enzyme may itself be toxic to the  
30 retina and/or other anatomical structures of the eye.

-6-

See, The Safety of Intravitreal Hyaluronidase; Gottlieb, J.L.; Antoszyk, A.N., Hatchell, D.L. and Soloupis, P., Invest Ophthalmol Vis Sci 31:11, 2345-52 (1990).

The ophthalmic toxicity of some hyaluronidase  
5 preparations has been confirmed by other investigators, who have proposed that such hyaluronidase preparations be used as a toxic irritant for causing experimentally-induced neovascularization of the eye, in animal toxicity models. see, An Experimental Model of  
10 Preretinal Neovascularization in the Rabbit; Antoszyk, A.N., Gottlieb, J.L., Casey, R.C., Hatchell, D.L. and Machemer, R., Invest Ophthalmol Vis Sci 32:1, 46-51 (1991).

Unfortunately, it has not been previously known  
15 whether the reported therapeutic activities and toxicities of hyaluronidase are universally applicable to all hyaluronidase preparations, or whether such efficacies and/or toxicities are applicable only to hyaluronidase preparations containing certain excipient  
20 materials or to hyaluronidase enzymes derived from specific sources. This is an important consideration in view of the fact that the purity and characterization (e.g., molecular weight distribution) of the various hyaluronidase preparations used in the prior art may  
25 vary, depending on the source of the hyaluronidase and the solvents and/or other formulation components with which the hyaluronidase is combined.

-7-

**iv. Purity and Characterization of Hyaluronidase Preparations Previously used for Ophthalmic Administration**

5           The term "hyaluronidase" is commonly used to describe a group of endo- $\beta$ -glucuronidase enzymes which depolymerize certain mucopolysaccharides, such as hyaluronic acid. Myer, K. et al., The Enzymes; Vol. 4, 2d, Ed., pp 447, Academic Press, Inc., New York (1960).

10           Hyaluronidase causes hydrolysis of the endo-N-acetyl hexosaminic bonds of hyaluronic acid and of the chondroitin sulfate acids A and C, primarily to tetrasaccharide residues.

          Significant evidence indicates that hyaluronidase  
15 enzymes derived from different sources differ in enzyme molecular weight distribution and in specific enzymatic activities. Such variability in molecular weight distribution and specific enzymatic activity are noteworthy considerations in view of the fact that  
20 hyaluronidase enzymes may be isolated from a variety of sources, including bovine testes, ovine testes, certain bacteria such as streptomyces and certain invertebrate animals such as leaches.

          The Wydase® hyaluronidase preparation is reported to  
25 have been previously administered to the eyes of mammals for various clinical and experimental applications, including the treatment of glaucoma and the promotion of liqudifacation of the vitreous body during vitrectomy procedures wherein the vitreous body is removed from the  
30 eye.

-8-

Although some hyaluronidase preparations have been reported to exhibit desirable therapeutic effects when injected into or administered topically to the eye, the potential toxicities of hyaluronidase and/or the thimerosal preservative are cause for concern regarding the safety of routine clinical administration of such, preparations by intraocular injection.

Accordingly, there exists a need in the art for the formulation and development of a new hyaluronidase preparation which may be administered to the eye at dosage levels which are sufficient to bring about optimal therapeutic effects, but which do not cause ocular toxicity.

Additionally, in view of the above-discussed problems associated with the slowness of natural clearance of hemorrhagic blood from the vitreous body, there exists a need in the art for the elucidation and development of new methods and procedures for accelerating the clearance of hemorrhagic blood from the vitreous body of the eye so as to permit trans-vitreous viewing of the posterior aspect of the eye, including the retina, without the need for removal of the vitreous body (i.e., total or partial vitrectomy).

25

#### **SUMMARY OF THE INVENTION**

The present invention provides a method for accelerating the clearance of hemorrhagic blood from the vitreous humor of a mammalian eye, wherein the method

-9-

comprises the step of contacting, with the vitreous humor, an amount of an enzyme which is active to accelerate the clearance of hemorrhagic blood from the vitreous humor. Specific enzymes which may be administered to bring about the hemorrhage clearing effect of the present invention include  $\beta$ -glucuronidases such as hyaluronidase, keratinase, chondroitinase AC, chondroitinase B and chondroitinase ABC; chondroitin sulfatases such as chondroitin 4 sulfatase and chondroitin 6 sulfatase; matrix metalloproteinases such as matrix metalloproteinase 1, matrix metalloproteinase 2, matrix metalloproteinase 3 and matrix metalloproteinase 9; and protein-kinases such as streptokinase and urokinase.

Further in accordance with the present invention, there is provided an improved, thimerosal free, hyaluronidase preparation which is suitable for administration onto or within the eye as a therapeutic agent for the treatment of various disorders including, but not limited to, the acceleration of the clearance of hemorrhagic blood from the vitreous humor in accordance with the hemorrhage-clearing methodology of the present invention. This hyaluronidase preparation of the present invention comprises a preferred hyaluronidase enzyme which is substantially devoid of hyaluronidase molecules having molecular weights in excess of 100,000MW, between 60,000-70,000MW and/or below 40,000MW. The preferred hyaluronidase of the present invention may be obtained

-10-

from ovine testes, and may be combined in aqueous solution with quantities of lactose and phosphate, to provide a thimerosal-free aqueous hyaluronidase solution for intraocular injection.

5 Further objects and advantages of the present invention will become apparent to those skilled in the area upon reading and understanding of the following detailed description, the accompanying figures, and the examples set forth therein.

10

#### **BRIEF DESCRIPTION OF THE DRAWINGS**

Figure 1 shows an electrophoresis gel having lanes 1-6, said lanes indicating 1) molecular weight standards from 31,000MW through 200,000MW 2) ovine hyaluronidase (ACS), 3) bovine hyaluronidase type VI-S, 4) ovine  
15 hyaluronidase type V, 5) bovine hyaluronidase type IV-S and 6) bovine hyaluronidase type I-S.

Figure 2 is a table which summarizes the zymographically determined hyaluronic acid lysing,  
20 gelatinolytic and casienolytic activities of the hyaluronidase ACS of the present invention, in comparison to bovine hyaluronidases of types VI-S, IV-S and I-S and ovine hyaluronidase of type V.

Figure 3 is a table which summarizes the toxic  
25 effects of single dose intravitreal injections of BSS, BSS + thimerosal, hyaluronidase (ACS) and hyaluronidase Wydase® in rabbits, in accordance with Example I herebelow.

-11-

Figure 4 is a table which summarizes the efficacy of single-dose intravitreal hyaluronidase (ACS) in rabbits, in accordance with Example II herebelow.

Figure 5 is a table which summarizes the safety and efficacy of multiple doses of intravitreal hyaluronidase (ACS) in rabbits, in accordance with Example III herebelow.

Figure 6 is a table which summaries the hemorrhage-clearing efficacy of single dose hyaluronidase ACS in human patients having diabetic retinopathy, in accordance with Example IV herebelow.

#### **DETAILED DESCRIPTION OF THE PREFERRED EMBODIMENTS**

The following detailed description and the accompanying examples are provided for purposes of describing and explaining certain preferred embodiments of the invention only, and are not intended to limit the scope of the invention in any way.

##### **i. Enzymatic Method For Accelerating Clearance Of Hemorrhagic Blood From the Vitreous of the Eye**

In accordance with the invention, applicant has determined that certain types of enzymes, when contacted with the vitreous humor following hemorrhage thereinto, will accelerate the rate at which the hemorrhagic blood is cleared from the vitreous humor.

In this regard, Applicant has devised a method for accelerating clearance of hemorrhagic blood from the vitreous of the eye, said method generally comprising the

-12-

step of contacting, with the vitreous humor, at least one enzyme in an amount which is active to accelerate the clearance of hemorrhagic blood from the vitreous humor. This hemorrhage-clearing method of the present invention  
5 may be performed without any vitrectomy or other surgical manipulation or removal of the vitreous humor, thereby avoiding the potential risks and complications associated with such vitrectomy procedures.

Specific  $\beta$ -glucuronidase enzymes which exhibit this  
10 hemorrhage-clearing effect include:

- Hyaluronidase
- Keratinase
- Chondroitinase AC
- Chondroitinase B
- 15 • Chondroitinase ABC
- Chondroitin 4 sulfatase; and
- Chondroitin 6 sulfatase

Specific metalloproteinase enzymes which exhibit this hemorrhage-clearing effect include:

- 20 • Matrix Metalloproteinase-1
- Matrix Metalloproteinase-2
- Matrix Metalloproteinase-3
- Matrix Metalloproteinase-9

Specific protein-kinase enzymes which exhibit this  
25 hemorrhage-clearing effect include:

- Streptokinase
- Urokinase

-13-

The preferred route of administration of these hemorrhage-clearing enzymes is by intraocular injection. whereby an injectable solution containing one or more of the above-listed hemorrhage clearing enzymes is injected, through a needle, directly into the vitreous body located within the posterior chamber of the eye. Alternatively, however, the hemorrhage-clearing enzyme(s), of the present invention may be administered by any other suitable route of administration (e.g., topically) which results in sufficient distribution of the enzyme(s) to the vitreous body to cause the desired hemorrhage-clearing effect.

The preferred injectable solution of the hemorrhage-clearing enzyme(s) may contain, in addition to the hemorrhage-clearing enzyme(s), certain inactive ingredients which cause the solution to be substantially isotonic, and of a pH which is suitable for injection into the eye. Such solution for injection may be initially lyophilized to a dry state and, thereafter, may be reconstituted prior to use.

**ii. A Preferred Hyaluronidase Preparation  
For Ophthalmic Administration**

A general formulation for an injectable thimerosal-free, hyaluronidase preparation, of the present invention is shown in Table I as follows:

-14-

Table I

## General Formulation

| <u>Ingredient</u>   | <u>Quantity</u>            |
|---------------------|----------------------------|
| Hyaluronidase (ACS) | 0-8000 International units |
| Lactose, USP        | 13.3 mg-133.0mg            |
| Phosphate, USP      | 5-200 mmoles               |

These formulation ingredients are initially dissolved in sterile water, sterile filtered and subsequently lyophilized to a dry composition. The lyophilized composition is packaged for subsequent reconstitution prior to use, in balanced salt solution. Such balanced salt solution typically contains: 0.64% sodium chloride, 0.075% potassium chloride, 0.048% calcium chloride dihydrate, 0.03% magnesium chloride hexahydrate, 0.39% sodium acetate trihydrate, 0.17% sodium citrate dihydrate, sodium hydride/hydrochloric acid to adjust the pH, and water for injection qs 100%.

The term "hyaluronidase ACS" as used herein describes a preferred hyaluronidase which is devoid of hyaluronidase molecular weight fractions above 100,000, between 60,000-70,000 and below 40,000. Such hyaluronidase may be derived from ovine testicles and is available commercially from Calbiochem Biochemicals, P.O. Box 12087, La Jolla, Ca 92039-2087. Applicants have determined that this specific molecular weight distribution of the hyaluronidase ACS results in less

-15-

ophthalmic toxicity than other hyaluronidase preparations, while exhibiting desirable therapeutic efficacy in a number of ophthalmic applications.

Figure 1 shows an electrophoresis gel (10% SDS-PAGE) which demonstrates the molecular weight distribution of the preferred hyaluronidase ACS in comparison to the molecular weight distributions of bovine type VI-S, IV-S and I-S and ovine type V hyaluronidases obtained from Sigma Chemical Company, P.O. Box 14508, St. Louis, Missouri 63178. Standardized amounts (i.e., equivalent units of hyaluronidase activity) of each enzyme was loaded into each lane (lanes 2-6) of the electrophoresis gel shown in Figure 1. Lane 1 of the electrophoresis gel shown in Figure 1 contains molecular weight markers at 200,000MW, 116,000MW, 97,400MW, 66,000MW, 45,000MW, and 31,000mw, respectively. Lanes 2-6 of the electrophoresis gel shown in Figure 1 contain the respective hyaluronidase preparations tested, as follows:

|    | LANE | WHAT IS IN THE LANE            |
|----|------|--------------------------------|
| 20 | 2    | Hyaluronidase ACS              |
|    | 3    | Bovine Hyaluronidase type VI-S |
|    | 4    | Ovine Hyaluronidase type V     |
|    | 5    | Bovine Hyaluronidase type IV-S |
|    | 6    | Bovine Hyaluronidase type IS   |

25

Lane 2 shows that the molecular weight distribution of the hyaluronidase ACS includes molecular weight fractions of 97,400, 50,000 (approx.) and 45,000

-16-

(approx.), but is clearly devoid of molecular weight fractions above 100,000, between 60,000 - 70,000 and below 40,000.

Lanes 3, 4, 5 and 6 of the electrophoresis gel of Figure 1 show that all of the bovine testicular hyaluronidases of types VI-S, IV-S and I-S and ovine testicular hyaluronidase of type V tested differ from the hyaluronidase ACS of the present invention in that they include molecular weight fractions between 60,000-70,000MW and below 40,000MW. Also, three (3) of the four (4) bovine testicular hyaluronidases tested (i.e., types VI-S, IV-S and I-S) included hyaluronidase molecular weight fractions which were in excess of 100,000MW.

Additionally, zymograms were preformed to compare the relative lytic activities of standardized amounts (i.e., equivalent units of hyaluronidase activity) of the above-described hyaluronidase ACS, type VI-S, V, IV-S and I-S bovine hyaluronidases upon hyaluronic acid, gelatine and casein. With respect to Figure 2, the specific methods by which each of these zymograms was performed are as follows:

Zymogram for Gelatinolytic Activity

GELATIN- 1mg/ml gelatin; 10% polyacrylamide;  
overnight buffer=50mM Tris HCl, 5mM CaCl<sub>2</sub>,  
0.05% TritonX-100 pH 7.5; stain Coomassie  
blue; destain 10% acetic acid/50% methanol.

-17-

Zymogram for Caseinolytic Activity

CASEIN-4 mg/ml; 15% polyacrylamide; overnight  
buffer=50 mM Tris/HCl, 5 mM CaCl<sub>2</sub> and 0.05%  
Triton X-100 pH 7.5; stain Coomassie blue;  
5 destain 10% acetic acid/50% methanol

Zymogram for Hyaluronic Acid Lysing Activity

HYALURONIC ACID 2 mg/ml, 10% polyacrylamide;  
overnight buffer=phosphate buffered saline, pH  
10 7.4; stain 0.5% alcian blue in 3% acetic acid;  
destain 10% acetic acid/50% methanol

The results of these hyaluronic acid, gelatin and  
casein zymograms are summarized in the table of Figure 2.  
15 Notably, the preferred hyaluronidase ACS of the present  
invention is devoid of hyaluronic acid lysing molecular  
weight fractions above approximately 100,000MW while each  
of the bovine testicular hyaluronidases tested (i.e.,  
types VI-S, IV-S and I-5) contained hyaluronic acid  
20 lysing molecular weight fractions above 100,000MW.

Similarly, the hyaluronidase ACS of the present  
invention was devoid of gelatinolytic molecular weight  
fractions between approximately 60,000-100,000MW, while  
each of the bovine testicular hyaluronidases tested  
25 included gelatinolytic molecular weight fractions between  
approximately 60,000-100,000MW.

Also, the hyaluronidase ACS of the present invention  
was devoid of caseinolytic molecular weight fractions

-18-

above approximately 45,000MW while each of the bovine testicular hyaluronidases (i.e., types VI-S, IV-S and I-S) and ovine testicular hyaluronidase (type V) tested did contain caseinolytic molecular weight fractions above  
5 approximately 45,000MW.

The specific molecular weight distribution and specific enzyme activity profile of the preferred hyaluronidase (ACS) of the present invention, and/or the exclusion of thimerosal from its formulation, provides a  
10 hyaluronidase preparation which is non-toxic to the eye when administered at dosage levels at which other hyaluronidase preparations would cause toxic effects.

For use in the examples set forth herebelow, the preferred hyaluronidase ACS was prepared in a thimerosal  
15 free formulation by the method and general formula described herebelow and shown in Table I. More specifically, the hyaluronidase used in the following examples prepared in accordance with the specific formulation shown in Table II herebelow.

-19-

Table II

## Specific Formulation

| <u>Ingredient</u>   | <u>Quantity</u> |
|---------------------|-----------------|
| Hyaluronidase (ACS) | 7,200 I.U.      |
| Lactose USP         | 13.3 mg         |
| Phosphate USP       | 5 mmoles        |

As described in the following examples, the specific preferred formulation as hyaluronidase ACS set forth in Table II (above) may be injected directly into the posterior chamber of the eye at dosage levels which bring about desirable therapeutic affects, including but not necessarily limited to the intravitreal hemorrhage clearing effect of the present invention, without causing significant toxicity to the eye or associated anatomical structures.

## Examples I

Ophthalmic Toxicities of Thimerosal, Hyaluronidase (ACS)20 and Hyaluronidase (Wydase®) in Rabbits

Fifty-Two (52) healthy rabbits of the New Zealand Cross variety (26 male, 26 female) weighing 1.5 kg to 2.5 kg, were individually marked for identification and were housed individually in suspended cages. The animals received a commercially available pelleted rabbit feed on a daily basis, with tap water available ad libitum.

-20-

The animals were divided into thirteen groups of 4 animals each (2 male, 2 female). Two animals in each group (1 male, 1 female) were selected for pretreatment fundus photography and fluorescein angiography.

5       The fundus photography was performed by restraining the animals and visualizing the optic nerve, retinal arcades and fundas with a KOWA® RC-3 Fundus Camera loaded with Kodak Gold 200 ASA film.

10       The fluorescein angiography involved a 1.5 ml injection of 2% sterile fluorescein solution via the marginal ear vein. Approximately 30 seconds post-injection the fluorescein was visualized upon localization of the optic nerve, retinal vessels and fundas.

15       The following day, each animal was anesthetized by intravenous administration of a combination of 34 mg/kg of ketamine hydrochloride and 5 mg/kg xylazine. The eyelids were retracted using a lid speculum, and the eyes were disinfected with an iodine-providone wash.

20       Experimental treatments of either balanced salt solution (BSS), BSS + thimerosal, hyaluronidase (Wydase®) or hyaluronidase (ACS) were administered by injection using a 1cc tuberculin syringe with a 30 guage, 0.5 inch needle attached thereto. The hyaluronidase (ACS)  
25       solution utilized in this example was free of thimerosal and constituted the specific preferred hyaluronidase ACS formulation set forth in Table II hereabove.

-21-

The experimental treatments administered to each animal group were as follows:

|    | <u>Group #</u> | <u>Treatment</u>              |
|----|----------------|-------------------------------|
| 5  | 1              | BSS                           |
|    | 2              | BSS + 0.0075 mg Thimerosal    |
|    | 3              | BSS + 0.025 mg Thimerosal     |
|    | 4              | Hyaluronidase (Wydase) 1 IU   |
|    | 5              | Hyaluronidase (Wydase) 15 IU  |
| 10 | 6              | Hyaluronidase (Wydase) 30 IU  |
|    | 7              | Hyaluronidase (Wydase) 50 IU  |
|    | 8              | Hyaluronidase (Wydase) 150 IU |
|    | 9              | Hyaluronidase (ACS) 1 IU      |
|    | 10             | Hyaluronidase (ACS) 15 IU     |
| 15 | 11             | Hyaluronidase (ACS) 30 IU     |
|    | 12             | Hyaluronidase (ACS) 50 IU     |
|    | 13             | Hyaluronidase (ACS) 150 IU    |

The day following the injections (Day 1), the 26 animals which were subjected to the fundus photography and fluorescein angiography were observed using the same methods as for the predose examination.

On Day 2 following the injections, the 13 male rabbits that had received the fundus photography and fluorescein angiography at predose and Day 1, as well as the 13 female rabbits that were not selected for photography were euthanized with a sodium pentobarbital based drug. The eyes were then surgically removed and placed in a fixtured solution of 2.5% glutaraldehyde with 0.1 M phosphate buffered saline at pH 7.37.

Alternatively, one randomly selected rabbit was euthanized by pentobarbital injection but then fixed by intracardiac injection of the of the glutaraldehyde solution into the left ventricle to determine the effect of the fixation procedure on the histology findings within the enucleated eyes.

-22-

On Day 7, the 13 female rabbits that had been previously photographed and angiography performed were subjected to the same observations following the methods previously described.

5       The remaining 26 animals were euthanized as described above 7 days after dosing. The eyes were fixed in the same manner as those which had been fixed on day 2. Also, one randomly selected rabbit was subjected to the same intracardiac glutaraldehyde fixation procedure  
10       described hereabove for the previously randomly selected animal.

The eyes of the animals treated in this example were examined grossly and microscopically for evidence of treatment-related toxicities. A table setting forth a  
15       summary of the histological evidence of toxicity or non-toxicity in each treatment group, is set forth in Figure 3. In summary, the eyes of the BSS-treated control group were free of toxicity at 2 and 7 days post dose.

The eyes of the Group No. 2 animals treated with  
20       BSS+thimerosal (0.0075mg) were free of toxicity at day 2, but exhibited evidence that there was a breakdown of the blood-retinal barrier at day 7.

The Group No. 3 animals treated with BSS + thimerosal (0.025mg) exhibited severe treatment-related  
25       toxic effects, at days 2 and 7 post dose.

The Group No. 4 animals treated with Wydase® at the 1 I.U. dose were free of toxicity at days 2 and 7, however, the eyes of the animals in Group Nos. 5-8

-23-

treated with Wydase® at dosages ranging from 15 I.U. -150 I.U. exhibited generally dose-related toxic effects at days 2 and 7 post dose.

The eyes of animals in treatment Groups Nos. 9-13  
5 treated with hyaluronidase (ACS) at dosages ranging from 1 I.U. through 150 I.U., were free of evidence of toxic effects at days 2 and 7 post dose.

Accordingly, it is concluded that thimerosal and the thimerosal-containing Wydase® formulation do cause toxic  
10 effects in the eyes of rabbits at the dosages tested, however, hyaluronidase (ACS) caused no toxic effects in these animals at the dosages tested.

The results of the examinations conducted on day 7 are summarized in Figure 3. As shown, Figure 3,  
15 significant toxic effects were observed on day 7 in the eyes of rabbits treated with BSS plus thimerosal (0.0075mg.) and hyaluronidase (Wydase) at all doses between 1 I.U.-150 I.U. In contrast, no toxic effects were observed in the eyes of animals treated with  
20 hyaluronidase (ACS) at doses between 1-50 I.U.

## EXAMPLE II

### Safety and Efficacy of Hyaluronidase (ACS) Injected Intravitreally in Rabbit Eyes

25

In this example, 12 healthy rabbits of the New Zealand Cross variety were marked for identification and individually housed in suspended cages. The animals received commercially pelleted rabbit feed on a daily  
30 basis and tap water was available ad libitum.

-24-

The animals were randomly divided into four (4) treatment groups of three (3) animals each.

Initially, the eyes of each animal were examined by dilation with 1-2 drops of 10% Tropicamide followed by gross examination, indirect ophthalmoscopy using a 20 diopter lens, and slit lamp examination of the anterior anatomy of the eye.

Following the initial examination of the animals eyes, 100  $\mu$ l or 10  $\mu$ l of blood was injected intravitreally into each eye of each animal.

On day 2, the animals of each treatment group received a single intravitreal injection of either BSS or Hyaluronidase (ACS) into the right eye, in accordance with the following treatment schedule:

|    | <u>Group #</u> | <u>Treatment</u> |   |
|----|----------------|------------------|---|
|    |                | <u>Left Eye</u>  | <u>Right Eye</u>                                    |
| 15 | A              | None             | BSS (30 $\mu$ l)x1                                  |
| 20 | B              | None             | 25 I.U.<br>Hyaluronidase<br>(ACS) in 30 $\mu$ l x 1 |
| 25 | C              | None             | 50 I.U.<br>Hyaluronidase<br>(ACS) in 30 $\mu$ l x 1 |
| 30 | D              | None             | 75 I.U.<br>Hyaluronidase<br>(ACS) in 30 $\mu$ l x 1 |

The hyaluronidase (ACS) preparation used in this experiment was the preferred formulation described hereabove and shown in Table II.

On days 3, 5, 7, 14 and 21 the eyes of each animal were again examined by slit-lamp to evaluate the cornea,

-25-

anterior chamber and iris. In addition, the eyes of each animal were dilated with 10% tropicamide solution and the retina was examined by indirect ophthalmoscopy with a 20 diopter lens.

5       The observed hemorrhage-clearing efficacy of hyaluronidase ACS is summarized in Figure 4. In general, the left eye (untreated) of each animal in each treatment group contained hazy vitreous and some blood clots, due to the quantity of blood which had been injected therein.

10   The right eyes of the BSS treated (control) animals of Group A also contained hazy vitreous and some blood clots, while the right eyes of all hyaluronidase-treated animals in Treatment Groups B-D contained vitreous which was clear and through which transvitreal visualization of

15   the retina was possible. Furthermore, the retinas of the rights eyes of all animals in Treatment Groups B-D appeared normal and free of treatment-related toxicity.

      The results of this experiment indicate that intravitreally administered hyaluronidase (ACS) was

20   effective at single doses of 25-75 I.U., to accelerate the rate at which blood was cleared from the eyes of the treated animals and further that such single doses of hyaluronidase (ACS) administered in this experiment did not cause observable toxic effects in the eyes of the

25   rabbits treated in this experiment.

      The observations following each dose were consistent and are summarized in Figure 5. In general, the left eye (untreated) of each animal in each treatment group,

-26-

contained hazy vitreous humor and some blood clots, due to the quantity of blood which had been injected therein. The right eyes of the BSS treated (control) animals of Group A also contained hazy vitreous and some blood  
5 clots, while the right eyes of all animals in treatment Groups B-E (i.e., the animals treated with hyaluronidase (ACS)) contained clear vitreous through which transvitreal visualization of the retina was possible. Furthermore, the retinas of the right eyes of all animals  
10 in treatment Groups B-D appeared to be normal and free of treatment-related toxicity, even after multiple doses of the hyaluronidase ACS.

The results of this experiment indicate that intravitreally administered hyaluronidase (ACS) was  
15 effective, at single doses of 25-75 I.U. x 4, to accelerate the rate at which blood was cleared from the eyes of rabbits and further that such dosages of hyaluronidase (ACS), and that such doses of hyaluronidase ACS did not cause observable toxic effects in the eyes of  
20 the treated rabbits, even after four (4) consecutive doses of hyaluronidase ACS administered at 2 week intervals.

### EXAMPLE III

25                   Hemorrhage Clearing Efficacy of  
                    Hyaluronidase (ACS) in Humans

In this experiment, six (6) human patients (5 female, 1 male) who presented with intravitreal  
30 hemorrhage were treated with single intravitreal

-27-

injections of Hyaluronidase (ACS) at dosages of 50-200 I.U.

The Hyaluronidase (ACS) administered in this experiment was prepared by the preferred formulation  
5 described hereabove and shown in Table II.

All of the patients treated in this experiment had a history of diabetic retinopathy, and were found to have intravitreal hemorrhages of varying duration. In each patient, the amount of blood present in the vitreous was  
10 sufficient to prevent viewing of the retina by standard funduscopy means.

Each patient received a single intravitreal injection of hyaluronidase (ACS). Four (4) patients received a dose of 50 I.U., one (1) patient received a  
15 dose of 70 I.U., and one patient received a dose of 200 I.U.

The observed results of this experiment are summarized in Figure 6.

In the six (6) patients treated in this example, the  
20 hemorrhagic vitreous became sufficiently clear to permit transvitreal viewing of the retina within 6-16 days of the single intravitreal injection of the hyaluronidase (ACS). Such clearing of the vitreous was subjectively determined to have occurred significantly faster than  
25 that which would have been expected to occur in these patients without hyaluronidase treatment.

The foregoing detailed description, examples, and accompanying figures have described the present invention

-28-

with reference to certain presently preferred embodiments thereof. It will be appreciated by those skilled in the art that various deviations may be made from the specific embodiments and formulations described hereabove, without  
5 departing from the intended spirit and scope of the present invention. Accordingly, it is intended that all such reasonable deviations be included within the scope of the following claims.

## WHAT IS CLAIMED IS:

1. A method for accelerating the clearance of hemorrhagic blood from the vitreous humor of a mammalian eye, said method comprising the step of:
  - 5           contacting with said vitreous humor an amount of an enzyme which is active to accelerate the clearance of hemorrhagic blood from the vitreous humor.
2. The method of Claim 1 wherein said enzyme is  
10   selected from the group consisting of:
  - hyaluronidase;
  - keratinase;
  - chondroitinase AC;
  - chondroitinase B;
  - 15   chondroitinase ABC;
  - chondroitin 4 sulfatase;
  - chondroitin 6 sulfatase;
  - matrix metalloproteinase-1;
  - matrix metalloproteinase-2;
  - 20   matrix metalloproteinase-3;
  - matrix metalloproteinase-9;
  - streptokinase;
  - urokinase; and,
  - combinations thereof.
- 25   3. The method of Claim 1 wherein said enzyme is a  $\beta$ -glucuronidase enzyme.
4. The method of Claim 1 wherein said enzyme is a matrix metalloproteinase enzyme.

-30-

5. The method of Claim 1 wherein said enzyme is a protein kinase enzyme.

6. The method of Claim 1 wherein said enzyme is a chondroitin sulfatase enzyme.

5 7. The method of Claim 1 wherein said enzyme is in liquid solution, and wherein the step of contacting of said enzyme with the vitreous humor comprises:

injecting said liquid solution into the vitreous humor.

10 8. The method of Claim 1 wherein said enzyme is hyaluronidase.

9. The method of Claim 8 wherein said amount of said hyaluronidase enzyme is 10-300 International Units.

10 10. The method of Claim 1 wherein said enzyme is administered in a single intravitreal injection.

11. The method of Claim 10 wherein the single intravitreal injection has an injectate volume of less than 50 $\mu$ l.

12. The method of Claim 8 wherein said hyaluronidase enzyme is devoid of molecular weight fractions above 100,000MW.

13. The method of Claim 8 wherein said hyaluronidase is devoid of hyaluronidase molecular weight fractions below 40,000MW.

14. The method of Claim 8 wherein said hyaluronidase is devoid of molecular weight fractions between 60,000-70,000MW.

-31-

15. The method of Claim 8 wherein said hyaluronidase is devoid of molecular weight fractions above 100,000MW below 40,000MW and between 60,000-70,000MW.

5 16. The method of Claim 8 wherein hyaluronidase enzyme is devoid of gelatinolytic hyaluronidase having molecular weights between approximately 60,000-100,000MW.

10 17. The method of Claim 8 wherein said hyaluronidase enzyme is devoid of caseinolytic hyaluronidase having molecular weight above approximately 45,000MW.

15 18. The method of Claim 8 wherein said hyaluronidase enzyme is devoid of hyaluronic acid lysing hyaluronidase having molecular weights above approximately 100,000MW.

19. The method of Claim 1 wherein said method further comprises:

contacting said enzyme with said vitreous humor in the absence of thimerosal.

20 20. The method of Claim 8 wherein said hyaluronidase enzyme is prepared in a solution for injection which is free of thimerosal and which has the general formulation:

Hyaluronidase (ACS).....0-8000 I.U.;

25 Lactose, USP.....13.3mg; and

Phosphate, USP....5 mmoles;

and, wherein the hyaluronidase enzyme is devoid of molecular weight fractions below 40,000.

-32-

21. The method of Claim 20 wherein said solution for injection has the following specific formulation:

Hyaluronidase (ACS).....7,200 I.U.;

Lactose, USP.....13.3mg; and

5           Phosphate, USP....5 mmoles.

22. The method of Claim 20 wherein said solution for injection is dissolved in balanced salt solution.

23. A hyaluronidase preparation for ophthalmic administration, said preparation being free of thimerosal  
10 and free of hyaluronidase which is less than 40,000MW.

24. The preparation of Claim 23 wherein said preparation is further free of hyaluronidase having molecular weights between 60,000-70,000MW.

25. The preparation of Claim 23 wherein said  
15 preparation is further free of hyaluronidase having a molecular weight in excess of 100,000MW.

26. The preparation of Claim 23 wherein said preparation is further devoid of hyaluronic acid lysing hyaluronidase having molecular weight above approximately  
20 100,000MW.

27. The preparation of Claim 23 wherein said preparation is further devoid of caseinolytic hyaluronidase having molecular weight above approximately 45,000MW.

25       28. The preparation of Claim 23 wherein said preparation is further devoid of gelatinolytic hyaluronidase having molecular weight between approximately 60,000-100,000MW.

-33-

29. The preparation of Claim 23 wherein said preparation is a solution for injection having the following general formulation:

Hyaluronidase (ACS).....0-8000 I.U.;

5 Lactose, USP.....13.3-133.3mg; and

Phosphate, USP....5-200 mmoles;

and, wherein the hyaluronidase enzyme is devoid of molecular weight fractions below 40,000.

30. The preparation of Claim 29 wherein the amount  
10 of hyaluronidase (ACS) in said formulation is 7,200 I.U.

31. The preparation of Claim 29 wherein the components of said formulation are dissolved in balanced salt solution.

## INTERNATIONAL SEARCH REPORT

 International application No.  
PCT/US96/18843
**A. CLASSIFICATION OF SUBJECT MATTER**

IPC(6) : A61K 38/43, 38/46, 38/48, 38/00, 31/715

US CL : 424/94.1, 94.62, 94.64, 94.67, 601; 514/2, 53

According to International Patent Classification (IPC) or to both national classification and IPC

**B. FIELDS SEARCHED**

Minimum documentation searched (classification system followed by classification symbols)

U.S. : 424/94.1, 94.62, 94.64, 94.67, 601; 514/2, 53

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practicable, search terms used)

Please See Extra Sheet.

**C. DOCUMENTS CONSIDERED TO BE RELEVANT**

| Category*       | Citation of document, with indication, where appropriate, of the relevant passages   | Relevant to claim No.                           |
|-----------------|--|---|
| X<br>-----<br>Y | US 4,174,389 A (COPE) 13 November 1979, see column 5, lines 38-46.   | 1, 7, 10, 11<br>-----<br>4                      |
| X               | CHAPMAN-SMITH, J.S. et al. Urokinase in the management of vitreous haemorrhage. British Journal of Ophthalmology 1977. Vol 61, pages 500-505, entire document. | 1, 2  |
| X<br>-----<br>Y | GOTTLIEB et al., The Safety of Intravitreal Hyaluronidase, Invest. Ophthalmol. Vis. Sci. 1990. Vol. 31, No. 11, pages 2345-2352, entire document.              | 1, 2, 8, 9<br>-----<br>1-3, 6, 8, 12-15, 18, 19 |

Further documents are listed in the continuation of Box C.

See patent family annex.

|   |  |
|---|--|
| * Special categories of cited documents:  | *T* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention  |
| *A* document defining the general state of the art which is not considered to be of particular relevance  | *X* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone   |
| *E* earlier document published on or after the international filing date  | *Y* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art |
| *L* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified) | *G* document member of the same patent family  |
| *O* document referring to an oral disclosure, use, exhibition or other means  |  |
| *P* document published prior to the international filing date but later than the priority date claimed  |  |

Date of the actual completion of the international search

20 FEBRUARY 1997

Date of mailing of the international search report

26 MAR 1997

 Name and mailing address of the ISA/US  
Commissioner of Patents and Trademarks
